1. Introduction

Asian Consulting Engineers hired the services of SGS Pakistan (Pvt.) Ltd. to conduct an environmental monitoring at four sites in Lahore. An environmental monitoring was conducted at mutually agreed sampling points. This report is prepared on the basis of monitoring conducted at Asian Consulting Engineers, Lahore. Field survey was carried out from January 23 to 27, 2015 for ambient air quality monitoring,dust estimation, meteorological conditions and for noise level monitoring.

1.1 Study Objectives

Followings were the main objectives of the study:

- To assess the impact of facility operations on the quality of environment.
- To develop the strategies for improvement of environmental performance in the areas where it is exceeding from (NEQS).

1.2 Scope of Services

Scope of services covered following main components:

- Ambient Air Quality Monitoring
- Weather Conditions
- Noise Level Monitoring
- PM₁₀

1.2.1. Ambient Air Quality Monitoring

In accordance to National Environmental Quality Standards (NEQS) the following priority pollutants were monitored in the ambient air.

- Carbon Monoxide (CO)
- Nitrogen Dioxide (NO₂)
- Sulphur Dioxide (SO₂)
- Particulate Matter (PM₁₀)

In addition to above mentioned parameters, the weather conditions were also monitored in order to interpret ambient air quality. For the purpose following parameters would be monitored:

- Ambient Temperature
- Relative Humidity
- Barometric Pressure
- Wind Direction
- Wind Velocity

1.2.2. Noise Level Monitoring

Noise level using portable digital sound meter was monitored at same locations where the ambient air quality was monitored. The duration of monitoring was according to the standard at the sampling points.

1.3 Schedule

Detailed Environmental monitoring was conducted at the advised sites. The monitoring was conducted on January 23-27, 2015 for ambient air quality monitoring, meteorological data and for noise level monitoring.

2. Methodology

Following is the brief description of methodology adopted for this environmental monitoring:

2.1. Ambient Air Quality

Ambient air quality was monitored with the help of Mobile Air Quality Station equipped with the state of the art ambient air analyzers. Selection of sampling point was made considering the wind direction at the advised sampling site. Following pollutants were measured during monitoring:

- Carbon Monoxide (CO)
- Oxides of Nitrogen (NOx)
- Sulphur Dioxide (SO₂)
- Particulate Matter (PM₁₀)

2.1.1. Carbon Monoxide

Carbon monoxide monitoring was carried out using gas filter Correlation CO analyzer. Measurement range of the analyzer is 0-100 ppm. Continuous data was recorded for duration of 24 hrs and hourly average is reported.

2.1.2. Nitrogen Dioxide

Nitrogen Dioxide at the project site was measured using chemiluminescent analyzer. Measurement range of the analyzer is 0-50 ppb and 0-1000 ppm. Reference method used for detection of NO₂ is USEPA Method RFNA-1289-074.

2.1.3. Sulphur Dioxide

Concentration of Sulphur dioxide in ambient air of the project site is measured by using Pulsed Fluorescent Analyzer. Measurement range of the analyzer is 0-50 ppb and 0-1000 ppm. USEPA Designated Method EQSA-0486-060 was used to measure SO₂ concentrations.

Table 01: Methodology of Ambient Air Quality Monitoring

Air Pollutant	Monitoring Technique	Method	Measurement Range	Lowest Detection Limit
Carbon Monoxide (CO)	Gas Filter Correlation CO Analyzer	USEPA Designated Method RFCA-0981-054	0 – 100 ppm	0.01 ppm
Sulfur Dioxide (SO ₂)	Pulsed Fluorescent Analyzer	USEPA Designated Method EQSA-0486-060	0 – 50 ppb 0 – 100 ppm	1 ppb
Nitrogen Dioxide (NO ₂)	Chemiluminescent Analyzer	USEPA Designated Method RFNA-1289-074	0 – 50 ppb 0 – 100 ppm	1 ppb
Particulate Matter (PM ₁₀)	Light Scattering Technique	ISO 21501-4;2007	1-1000 µg/m ³	1 µg/m ³

2.1.4. Sampling and Analysis of Particulate Matter (PM₁₀)

Particulate matter concentration in terms of PM₁₀ was monitored in the ambient air with the help of Aerocet 531 Sampler. Reference method used for PM₁₀ determination in ambient air is ISO 21501-4; 2007.

Air sample for detection of PM₁₀ concentration counts individual particles utilizing scattered laser light and calculates the equivalent mass concentration.

2.2 Meteorological Conditions

In addition to the advised parameters for ambient air quality, weather conditions were also monitored continuously for 24 hours with the help of mobile weather station. Selection of sampling points was made considering the wind direction at the advised sampling site.

2.3 Noise Level Monitoring

Noise level monitoring was conducted at mutually agreed locations using portable Digital Sound Meter. Sound Pressure Level (SPL) measurements (in dB) were performed utilizing Sound Level Meter (European Class 1 Standard) complying with standards IEC60051 TYPE 1 IE60804 TYPE 1 JIS C 1505 in accordance to SGS Standard Operating Procedures (SOP).

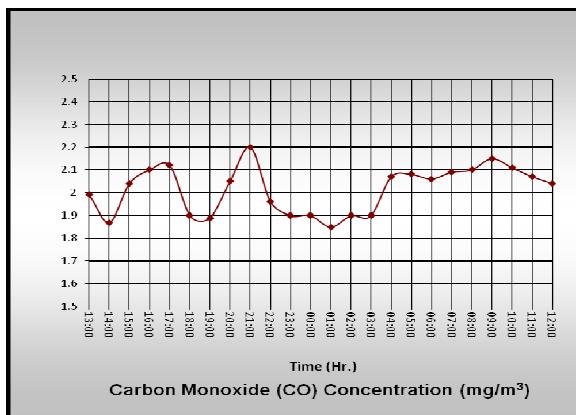

3. Results and Discussion

SGS Pakistan (Pvt.) Ltd. Conducted an environmental monitoring at client's advised sampling points. Scope of this monitoring covered monitoring of ambient air quality, weather conditions, dust estimation and noise level monitoring. The monitoring results are given as **Annexure I to III**.

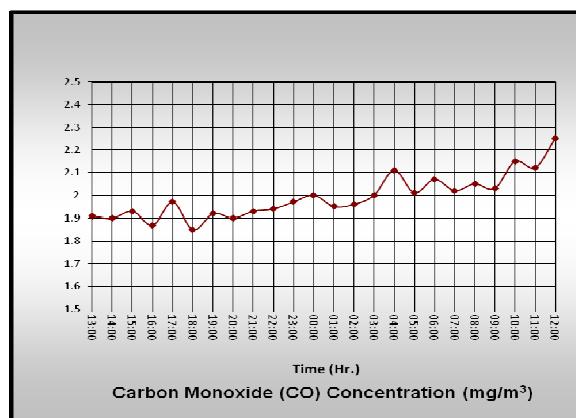

The results of ambient air quality monitored for 24 hrs are given in **Annexure-II** of the report. National Environmental Quality Standards (NEQS) for Ambient given in **Annexure-IV** used for comparison.

The average concentration of carbon monoxide (CO) for 08 hrs according to the National Environmental Quality Standards (NEQS) for Ambient Air should not exceed from 5.0 mg/m³. The values obtained were 2.01 mg/m³, 1.99 mg/m³, 2.05 mg/m³ and 2.18 mg/m³ at 'Liberty Roundabout', 'Fawara Chowk near Sadiq Trade Centre', 'Shadman Chowk' and at 'Qartaba Chowk' respectively.

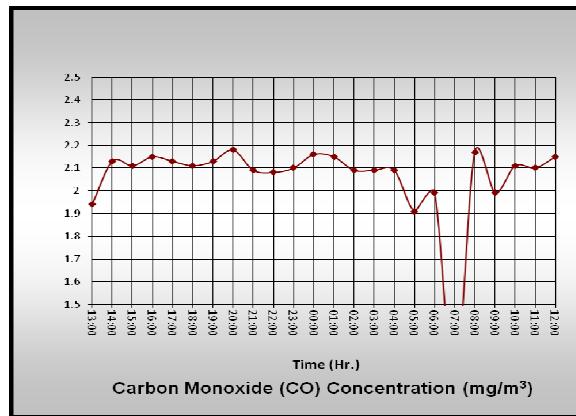

Graphs **01-04** show prevailing concentration of CO in mg/m³ at all four project sites during 24 hrs of monitoring.
